Jedi Pack inbox

Scout verdict, 22 Oct 2026. Primary track is Reasoning Architecture. The product is one decision: send, hold, or escalate, with the Zetaris rows that justified it.

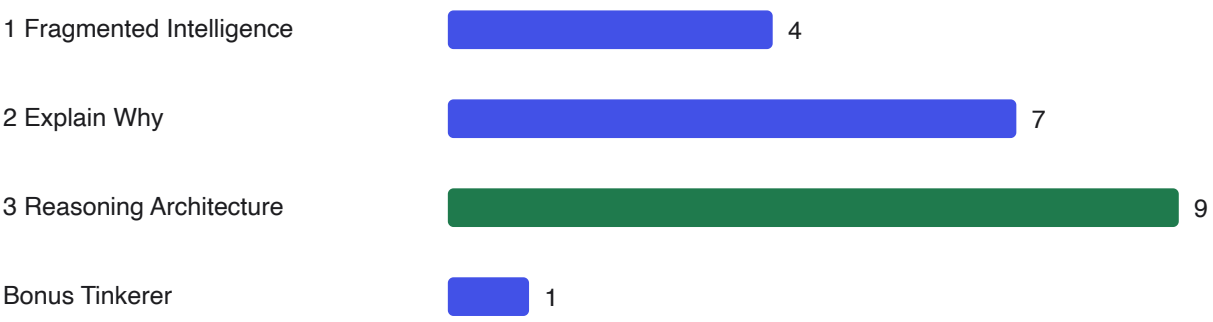

9/10	80	56	14/20
Track 3 fit	Scoped estimate / 100	Full list estimate / 100	Worksheet, as written

Rubric estimates are Scout's reading of the published weights in inputdocs/016. They are not a predicted judge score. Worksheet band 11–15 means reduce scope.

Closest track: 3, Reasoning Architecture

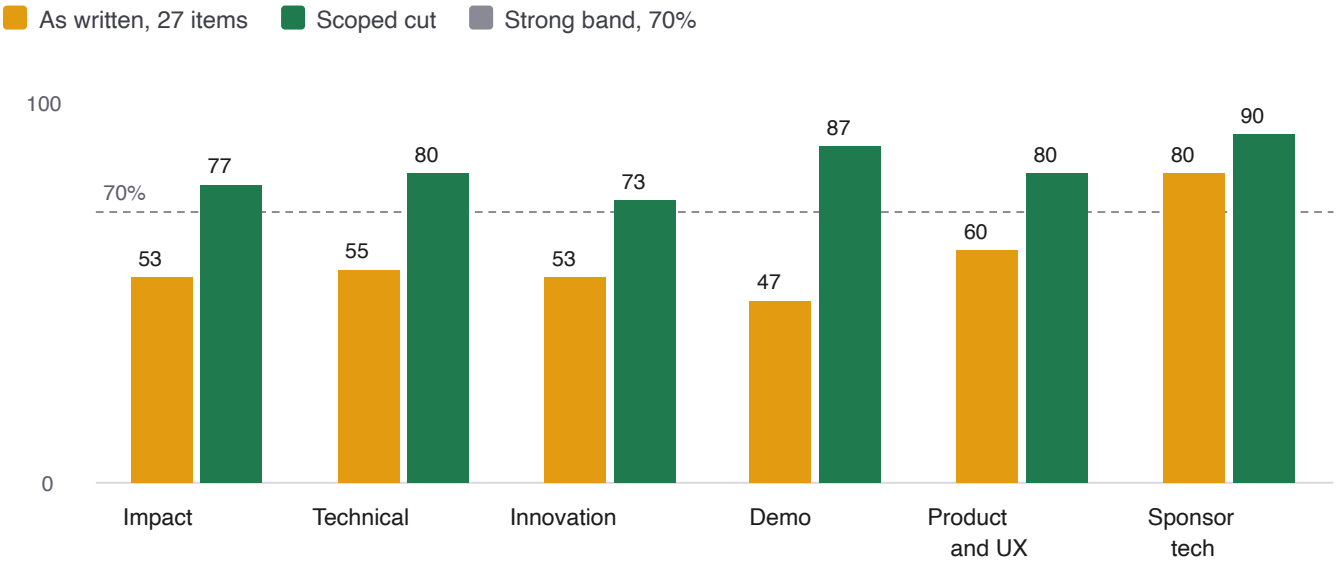

The official track 3 example is a front desk that combines availability, policy, and memory of past decisions, then produces a decision with the reasoning. This brief is that pattern for a company inbox: holiday, refund limit, responsible person, backup, and a trust floor, then send, hold, or escalate.

Fit to the published track text

Source: inputdocs/016 section 6, read 22 Oct 2026. Score is how closely the braindump matches that track's "what you build" sentence. Axis: track, fit score (0–10). Track 3 is the locked choice.

Estimated share of each rubric criterion

Each bar is the estimate divided by that criterion's maximum, so Impact (30) and Sponsor tech (10) can sit on one axis. Axis: criterion, share of that criterion's points (%). Source: Scout estimate, 22 Oct 2026.

Point estimates behind the chart

Criterion	Max	As written	Scoped cut	What moves it
Impact	30	16	23	Name the mailbox owner and the decision. A fictional company is fine if the README says so.
Technical	20	11	16	Deterministic gates, Scout's risk check, and the Nightshift judge. The 27-item list will not finish.
Innovation	15	8	11	The held send is the idea. An auto-reply alone is a known helpdesk product.
Demo	15	7	13	One thread: owner on holiday, amount over the limit, reply held, backup named.
Product and UX	10	6	8	Four counters, the draft, affirm or reject. One screen, queried from Zetaris.
Sponsor tech	10	8	9	Zetaris for the cited rows, and again for the dashboard. The Evaluator is the Nightshift judge. Risk is Scout's risk check. NVIDIA writes the draft and the critique.

Sponsor stack

A name in the README scores when a judge can see that piece change the decision. Gaia on this Mac is the web app. It stays the workspace.

Piece	Place	Job in the decision
Zetaris	Load-bearing	Holiday, HR, policy, and backup are rows the draft cites. The dashboard reads the same surface: counts, the draft, affirm and reject, weights, and token totals.
Scout Intent	Load-bearing	Classifies the mail and signs before send.
H-MEM	Load-bearing	A similar refund reuses the path. A human reject raises the floor. The escalate gate is queueForHuman.
World Model	Load-bearing	Ticket, thread, and who currently holds the claim.
Nightshift, NVIDIA	Load-bearing	POWER route. Nemotron drafts the reply. The Evaluator is Nightshift's judge lane, and Nemotron writes that critique.
Markovian	After the core	Long thread and the privacy scan as chunks with a short carryover.
Swarm	Cut from v1	Claim lock stays in the ticket table. Spawning workers waits.
Gaia	Workspace only	Web app on this Mac. World Model is what the product imports.
Relay	Method only	Orchestrator is code. The Windows app is not a judge dependency.
HARDEN	Prompt library	Scout guard on inbound mail before the model. Trust floor is the weight table.
POWER	Prompt library	Nightshift provider. NVIDIA Nemotron is the model inside it.
IMPLEMENT	Prompt library	Cursor builds the engines from the specs after the group keeps the brief.

Piece	Place	Job in the decision
Cursor	How it was built	Runs the Implement prompts.

The list is a company simulator

Twenty staff, 300 threads, three live channels, a swarm threshold, and three dashboard pages hide the decision. The cut is four Zetaris sources, 24 authored threads, file drop-ins for email, the contact form, and Trustpilot, and one screen with the four counters.
